Even so, battery banks are typically using a single 4.2v lithium battery / pouch or at best 2 such flat batteries in series... this means that a battery pack will have to boost 3v..4.2v or 6v..8v to 20v, so a lot of current will be pulled from the battery and the step-up converter will heat up substantially to produce those 20v at the current the motherboard wants.

In this example, we will consider a 7S lithium-ion battery running a 24-volt AC inverter. A 7S lithium-ion battery has a fully charged voltage of 29.4 volts and a dead voltage of about 18.5 volts. Drawing a 1100W load from the battery pack will require around 37 amps when the battery is fully charged. 1100 watts ÷ 29.4 volts = 37.4 Amps
