If your load requires a +3.3V voltage rail, simply use another regulator (an LDO type preferably) just near the load. The voltage level before R6 is around 9.5V, so by 150mA current consumption, this filter introduces a 1.5V ...

When a designer needs to convert DC into AC power, there are several ways to make an inverter. So, we thought why not try making an inverter using a battery of 1.5 Volts? Just, 1.5 volts and we can get 220V Ac at the output. So, maybe the question arises that the circuit then needs a lot of components to boost up the voltage.

VREG - It is the fixed 5V regulated output, from the IC. Since this output is derived from the 50V line any load on VREG might cause an equivalent current drop across VOUT. VREG will require at least 4.0V of headroom to generate the 5V, that is a minimum of 9V at VOUT. Since the IC is typically a linear regulator, the SR087 will dissipate
