$960 \text{ watts} * 1/0.85 \text{ inverter eff} * 1/12 \text{ volt battery bank} * 1/0.4 \text{ surge rating} = 235 \text{ AH minimum battery bank}$
12 volts Note that this is really a recommendation for flooded cell battery banks, but also keeps the stress down for AGM's too (which can surge upwards of 4°C for some brands/models of AGMs).

As an example I have one DEYE Sun 5000 and a Growatt SPF 5000ES; right now the battery bank is hooked to the Growatt, but would like both inverters connected to the mentioned bank. Problem is the battery only has one comm cable that came with the batteries (6 x Pylontech US3000C and 1 x US5000).

Locate Connections: Identify the AC output terminals on the inverter and DC input for connection to the battery bank. Connect Battery Cables: Use appropriate gauge cables to connect the inverter's DC terminals to the battery bank. Red cable connects to the positive terminal, and black cable connects to the negative.

This is because the terminals of your battery bank, inverter, and the overcurrent protection device (fuse or breaker) might not be able to withstand the temperature that the wire is rated for. So, unless all of the components that are going to be connected to the wire are explicitly rated for 75°C or more, you should
