Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

The average lead battery made today contains more than 80% recycled materials, and almost all of the lead recovered in the recycling process is used to make new lead batteries. For energy storage applications the battery needs to have a long cycle life both in deep cycle and shallow cycle applications.

Balancing power supply and demand is always a complex process. When large amounts of renewable energy sources (RES), such as photovoltaic (PV), wind and tidal energy, which can change abruptly with weather conditions, are integrated into the grid, this balancing process becomes even more difficult [1], [2], [3]. Effective energy storage can match total ...
