Battery Energy Storage Systems function by capturing and storing energy produced from various sources, whether it's a traditional power grid, a solar power array, or a wind turbine. The energy is stored in batteries and can later be released, offering a buffer that helps balance demand and supply.

Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.
