impedance, i.e. from a stiff DC current source. Voltage source inverters are generally classified into two types viz pulse width modulation and square wave. These inverters are introduced in early 1960's during the introduction of force commutating techniques. The major disadvantage of this inverter is that the output voltage

DC SUPPLY INVERTER LOAD Output of the inverter is "chopped AC voltage with zero DC component". It contain harmonics. An LC section low-pass filter is normally fitted at the inverter output to reduce the high frequency harmonics. In some applications such as UPS, "high purity" sine wave output is required. Good filtering is a must.
